* a getgitgirl guide

edit your reels with codex

drop in your raw video and get back a finished reel in your own brand, with the ums cut, captions on and graphics that match what you're saying. this guide walks you through setting it up, step by step, even if you've never opened terminal.

start here

you'll need a mac, the ChatGPT desktop app (a plan that includes Codex) and about 10 GB of free space.

open this guide on your mac, so you can copy commands straight into it.

full instructions and copyable commands are in the repo guide and local setup page:

github.com/nicolapocock/codex-reel-editor/blob/main/GUIDE.md

beginner friendly · local editing · built for codex

@getgitgirl

set it up, part 1

open Codex and your reel editor project. then check your tools.

two steps

01 get codex

get the ChatGPT desktop app from learn.chatgpt.com/docs/app, sign in, then switch to Codex. this editor works with files on your mac.

on GitHub, open nicolapocock/codex-reel-editor. choose Code → Download ZIP, unzip it, then open that folder in Codex.

02 open terminal

terminal is an app that's already on your mac. it's where you type commands. press cmd + space, type terminal and press return. a window opens with a line ending in %. that's the prompt, and it means terminal is ready.

1 the line ending in **%** is the prompt. click anywhere in the window, then paste with **cmd + v** and press **return**.

how every command works

copy it, click inside terminal, paste with cmd + v and press return. then wait until the % comes back on the last line before you paste the next one.

set it up, part 2

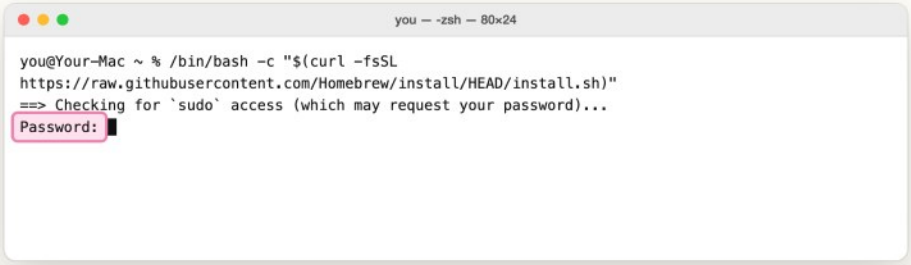

homebrew, the free app installer the video tools come from. 10 to 15 minutes, mostly waiting.

two steps

03 install homebrew

copy this, paste it into terminal and press return.

```
/bin/bash -c "$(curl -fsSL https://raw.githubusercontent.com/Homebrew/install/HEAD/install.sh)"
```

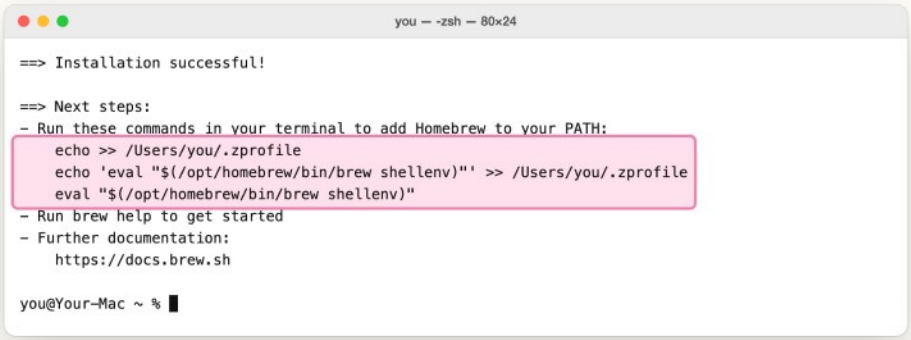

1. type the password you use to log in to your mac. **no letters or dots appear while you type**, that's normal.
2. press **return**. if it then says *press RETURN/ENTER to continue*, press return again.

then wait 5 to 10 minutes. it's finished when it says installation successful and the % comes back.

04 finish homebrew's setup

take this one slowly, the video tools won't install without it. scroll up to next steps, drag over the lines under it that start with echo or eval, and copy them (cmd + c). paste them at the bottom of terminal (cmd + v) and press return. copy yours, not the ones in the picture, they have your mac's name in them.

1. find **next steps**. drag over the lines in the pink box (yours show your mac's name instead of *you*) and copy with **cmd + c**.
2. click next to the **%** on the last line, paste with **cmd + v** and press **return**.

set it up, part 3

check homebrew, add the video tools, then the reel editor itself.

two steps

05 install the video tools

check homebrew worked first. paste this and press return. it should print Homebrew and a version number.

```
brew --version
```

then install the video tools. wait until the prompt comes back before continuing.

```
brew install ffmpeg node python
```

06 install the reel editor

in your Codex project, paste this into the message box:

```
Read AGENTS.md and skills/reel-editor/SKILL.md. Set REELS_HOME to this project's reels folder. Run npm ci, install missing HyperFrames skills and run the doctor check. Help me set up my brand.
```

use the local setup page's Copy buttons for full commands. Codex may request access to install dependencies; check the request before approving.

you're done when

the last line of the check says READY. READY WITH LIMITS is fine too, it means something optional is missing and you can still edit. see a red x? copy the whole message, paste it to codex and say "fix this".

your first reel

you film it and approve it, codex does the editing.

the edit, start to finish

01 **film yourself talking to camera**

on your phone is fine. under 2 minutes is easiest for your first one. airdrop it to your mac.

02 **drop it into Codex**

give Codex the full path to your raw video and say “edit this into a reel”. keep the original file unchanged.

03 **answer the brand questions (first time only)**

colours, fonts, caption style, sounds and pacing, one question at a time. have a reel you wish you'd made ready, it's the most useful thing you can give it. about 5 minutes.

04 **review it on your local page**

Codex prepares the transcript, starts the local review server and opens its link. review cuts, captions and graphics. nothing opens? ask it to start review_server.py with --enable-builds. the page runs on your mac.

05 **build the preview**

click build preview. saved edits can render locally; written creative notes need Codex to apply them first. the page shows progress and tells you when to return to chat.

06 **leave notes, then say final**

pause where something’s off and leave a timestamped note. check sound, hooks and hair edges. when happy, say “final” and Codex supplies the MP4 in your chosen delivery folder.

from your second reel on

it's just film, drop it in, review, final. your brand is saved, so every edit already looks like you.

extras + if you get stuck

your sound choices, reliable text placement and optional capcut delivery.

want the capcut version too? (optional)

the MP4 works on its own. optional CapCut delivery needs the installed plugin and your account connection. availability varies. graphics are baked in; request changes before export.

01 **make a free capcut account**

at capcut.com.

02 **paste this into Codex**

```
set up the optional capcut route for the reel editor, following references/capcut.md in the skill
```

03 **log in once**

connect the installed CapCut plugin in Codex when prompted. ask Codex to check the connection before sending any media.

if something goes wrong

command not found: brew

ask Codex to check your Homebrew install and the machine-specific Next steps. never copy someone else's paths.

the check shows a red x

paste the whole message into Codex and say "fix this".

the review page won't load

ask Codex to start the local review server and open its printed link. keep that server running.

sound or text looks wrong

use your own licensed sound files. captions stay fixed; hooks have shadows. give a timestamp for placement fixes.

hair or face gets clipped

remove static polygon masks. check the whole cutout in motion; use the original footage if it cannot be cleaned up.

your brand is saved. ask for one-line hooks, softer shadows or different sounds. review each draft before posting.
